Supplemental Box

(To be used when the space in any of the preceding boxes is not sufficient)

Continuation of Box V. 2:

• Claims 1-28

Document 2 states that stabilization is greatly enhanced when a vector used for gene therapy is modified by polyethylene glycol (PEG). In addition, as described in documents 3-6, the stabilization of a substance and delivery of that substance to a desired site by encapsulating it in a PEG-modified liposome in order to enhance its action was widely known by persons skilled in the art before the priority date of this application.

Thus, persons skilled in the art can easily conceive of modifying with PEG the peptide having an α -helix structure described in document 1 for delivering a gene into a cell to enhance its stability and physiological activity. Furthermore, in so doing, persons skilled in the art can substitute or add amino acids in consideration of the hydrophilicity or hydrophobicity of the peptide.

Moreover, this examination finds no particularly outstanding effect is provided by adopting the constitution of the inventions in the above claims.

As a result, this examination finds that persons skilled in the art could easily prepare the inventions of the above claims based on the descriptions in documents 1-6.
